

TSUBAKI PIN GEAR DRIVE UNITS

Tsubaki's Pin Gear Drive Unit replaces racks and gears.

Consisting of a pin mechanism used with a pin wheel and pin rack, and a gear with a unique tooth profile, Pin Gear Drive Units offer limitless design possibilities for linear and rotational drive sections.

Features

Easy installation

Employs a separable segmented design to ensure easy installation. Allows for more flexible installation precision than rack gears.

Large transmission torque

The pin gear is designed with a forgiving module, and the good pin wheel/rack balance delivers large transmission torque.

Usable in large-scale equipment

The increased number of segments allows for use in large drive units.

Drive system comparison

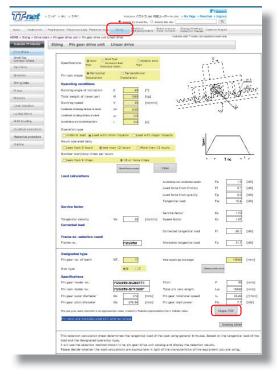

| Drive system | Installation man-hours | Transmission torque | Large equipment |
|---------------------|------------------------|---------------------|-----------------|
| Pin Gear Drive | 0 | 0 | 0 |
| Ordinary gear | \bigtriangleup | 0 | Δ |
| Chain-type pin gear | \bigtriangleup | 0 | 0 |

Tsubaki provides select software on its *TT-net*[°] website for general technical information about power transmission equipment.

The site is designed to facilitate product selection and includes downloadable drawings and instruction manuals.

Structure

Pin Gear Drive Units include a pin gear that meshes with a pin rack or pin wheel. The pin rack or pin wheel consists of a frame, bushings, and rollers. The bushes are all hollow pin-types that can also be used as mounting holes.

Bush (Hollow pin)

Unique Tooth Profile (Dislocated Tooth Profile)

The pin gear adopts a unique tooth profile to ensure smooth engagement with the pin rack or pin wheel and to guarantee strength. The continuous engagement of the teeth and the rollers results in flexible engagement. In addition, the steel teeth are hardened to improve strength and wear resistance.

Standard Specifications

* Backlash amounts are calculated figures and are not guaranteed values.

Special Backlash Specifications (Models with Varying Allowable Tangential Load)

- Large backlash specifications
 - Increased backlash improves the ease of installation.
- Small backlash specifications Models with less backlash are also available. (With 2/3 the backlash of standard backlash models; Applicable frames: PDU020–PDU120)

| Sluice/Movable Weir Specification | | | | | | 0 | | 0 | | 0 | | | | |

Steel Models (Standard Specification)

Features

Steel models are the most versatile type with support for all frame numbers.

High Anti-Rust Steel Models (Applicable Frames: PDU030–PDU120)

Features

Stainless steel models include special surface treatment for improved corrosion resistance and weather resistance without changing the standard tangential load.

Specifications

High anti-rust plating, high anti-rust coating, and high anti-rust painting options are available.

| Frame | High anti-rust plating | Special zinc and aluminum alloy plating |
|--------------|-------------------------|--|
| Roller, Bush | High anti-rust coating | Special zinc and resin coating |
| Pin Gear | High anti-rust painting | Special coating with corrosion resistance and weather resistance |

Stainless Steel Models (Standard Specification) (Applicable Frames: PDU020–PDU090)

Features

Stainless steel models are suitable for use in corrosive atmospheres and environments with low or high temperatures.

Specifications

All models are made of stainless steel.

Some steel models adopt different dimension. See the Table of Dimensions on page 6.

• Stainless Steel Models (Sluice/Movable Weir Specification; Linear Drive) (Applicable Frames: PDU050, PDU070, PDU090)

Features

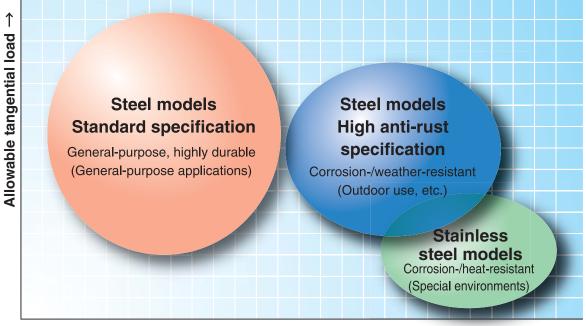

Sluice/movable weir specifications provide superior environmental resistance when stationary compared with standard specifications. These models also comply with technical standards (draft) for dam and weir facilities.

Specifications

All components on the stainless steel models are made of SUS304.

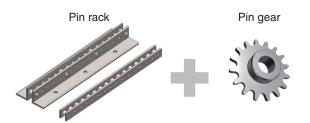

* The minimum number of teeth for pin gears has been established in consideration of safety factors per the technical standards (draft) for dam and weir facilities. The minimum number of teeth is 15 for PDU050 and PDU070, and 14 for PDU090.

Selection Guide

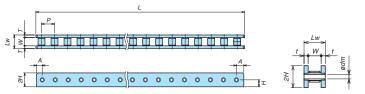

→ Corrosion resistance

Pin Rack (Linear Drive) Products and Specifications

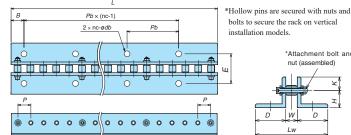

Horizontal installation (flat) pin rack: SPF

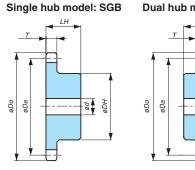

Vertical installation (angle) pin rack: SPA

Notes:

- 1. The standard pin count is based on the number of pins used in segments with lengths that make them easy to handle. In addition, the minimum length and minimum number of pins are set based on manufacturing limitations.
- 2. If the total number of pins exceeds the standard number of pins, the standard number of pins and the number of pins less than the standard length (equal to or more than the minimum number of pins) is used for configuration.
- 3. See page 14 for installation instructions.
- 4. Mounting bolts are not included.

Linear Drive Pin Gear

bolts to secure the rack on vertical installation models.

Dual hub model: SGC

pg DH

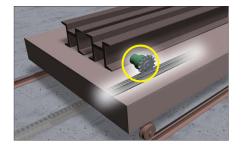

The angle shapes of vertically installed PDU180 and PDU240 differ.

 \ast Frame numbers PDU120 and above are for steel models only.

Lubrication

Lubrication is a very important task for Pin Gear Drives. Before operation, coat all peripheral roller surfaces with extreme pressure grease. The interior of the pin rack and pin wheel rollers are pre-coated with lubricating grease. See the instruction manual for more information.

Reference Material for Corrosion Resistance of Stainless Steel Models

Corrosion resistance may be altered depending on the operating conditions. The table below does not indicate any guaranteed levels. See the table below and use a test sample under actual operating conditions to confirm corrosion resistance before use. O: Sufficient corrosion resistance \triangle : Corrosion resistance depending on operating conditions \times : No corrosion resistance —: Uncertai

pin.

Example:Bolt mounting: PDU050-GPF064P 4-segment model Mounting position: See figure below (Mounting bolt positions indicated by black dots.)

PDU050 requires a minimum of 6, M12 mounting bolts. Install at least 6 bolts per segment as evenly as possible. * Contact Tsubaki if you are unsure about installation.

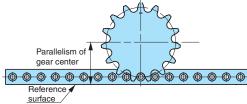

Installation Precision

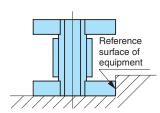

• Pin racks : Ensure that the parallelism of the equipment-side reference surface of the pin rack and the pin gear center is equal to or less than the indicated gear center parallelism in the table below by ensuring that the machine is correctly aligned in advance.

Ensure that the alignment along the A and B axes of adjoining pin racks is within the tolerance indicated in the table below.

• Pin wheels : Projections on the pin wheel frame share the same centers as the roller mounting holes, so projections can be used as a reference surface for centering when fitting the pin wheel into the pilot section on the equipment.

The precision of equipment pilot section must be finished within the precision of pilot section runout indicated in the table below.

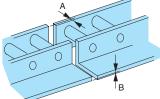

| * Always read th | ne instruction | manual | before | installing. |

14

Vertical Pin Rack

Angle racks can be attached to the device using the mounting bolt holes on the feet of the rack.

Pin Gear Drive Selection Procedure

Selection Procedure

1. Pre-select the pitch circle diameter of the Pin Gear Drive Unit.

- For linear operation: Pre-select the pitch circle diameter of the pin gear based on the equipment layout.
- For rotational operation: Pre-select the pitch circle diameter of the pin wheel to suit the size of the equipment. Determine the reduction gear ratio required, then pre-select the pitch circle diameter of the pin gear.

2. Calculate the applied tangential load (Fw).

Calculate the applied tangential load (Fw) that will act on the pin wheel or pin rack based on load conditions.

3. Calculate the corrected tangential load (Ft).

To calculate the corrected tangential load (Ft), obtain the service factor (Ks, Table 1) based on operating conditions, obtain the speed factor (Kv, Table 2) based on the tangential speed, and then multiply the product thereof by the applied tangential load (Fw).

 $Ft = Ks \times Kv \times Fw$

4. Select the frame number of the Pin Gear Drive Unit.

Using the allowable tangential load (Fp) of each pin wheel/pin rack frame number and the corrected tangential load (Ft), select the appropriate Pin Gear Drive Unit that satisfies the following condition:

Allowable tangential load (Fp) > Corrected tangential load (Ft)

5. Select the model number.

- Pin wheels: From the selected frame number and the pre-selected pin wheel pitch circle diameter, choose the quantity of rollers of the pin wheel closest to the pitch circle diameter.
- Pin racks: From the selected frame number and the total running distance (or total movement distance), calculate the quantity of rack rollers.
- Pin gears: From the selected frame number and the pre-selected pin gear pitch circle diameter, choose the model number of the pin gear with the number of teeth closest to the pitch circle diameter.
- Note:There are limits to the extent to which numbers of gear teeth can be used. (See table below.) If a gear does not have enough teeth, select a gear with a larger number of teeth.

Applicable Number of Teeth Range for Pin Gear

Safety Precautions

WARNING Observe the items below to prevent danger.

- Check that no torque is acting on the rotating shaft of the product or the equipment before installation and before performing maintenance and inspection work.
 Product function or performance may be adversely affected by mounting accuracy and load conditions or the wear and life of parts used. Implement safety measures for the equipment in advance and regularly perform maintenance and inspections.
- Follow all applicable local safety regulations as required.
- Observe the following when installing, removing, maintaining, or inspecting the product:
- Wear suitable clothes and protective gear (e.g., safety glasses, gloves, and shoes) when working.
- Turn off the main power switch of the equipment before conducting the work and take preventive measures so that the switch will not be turned on unexpectedly. Take the same precautions during a power failure.
- Read and follow the instructions in the operation manuals and catalogs before conducting the work.
- When servicing or inspecting equipment that is continually subject to a load, such as lifting equipment, remove the load before starting work or take steps to prevent the equipment from falling.

CAUTION Observe the items below to prevent accidents.

- Great force will act on the mount if the product is used for applications where the product is started and stopped frequently. Make sure that the mount is sturdy enough.
- Before using the device, read the instruction manual thoroughly, and ensure the device is used correctly. If no instruction manual is available, request an
- instruction manual from the distributor where the device was purchased, or from the Tsubaki sales office.
- Always make sure that the operation manual is delivered to the end user.
- Product details described in this catalog are primarily intended to aid product selection. Always read the instruction manual before using any product to ensure correct use.

Warranty

1. Warranty period without charge

Tsubakimoto Sprocket Co. (hereinafter referred to as "Company") provides a warranty without charge valid for either 18 months after the shipment of the purchased product (hereinafter referred to as "Goods") from the factory, or 12 months after the first use of Goods, whichever comes first. First use of Goods is considered to be the complete incorporation of Goods into the equipment of the purchasing party (hereinafter referred to as "Customer"). This warranty may be provided with charge in certain circumstances.

2. Warranty coverage

Should any malfunction in Goods arise during the warranty period, given that Goods were properly installed, operated, and maintained as instructed in the catalog, instruction manual, or similar, Company shall promptly deliver or repair Goods or the failed part at no charge once Company has confirmed such failure. This warranty only covers delivered Goods and therefore does not include the following: ("Instruction manual or similar" includes documentation specially provided to Customer.)

- Any costs required for the removal or mounting of Goods from or into Customer's equipment for repair or replacement.
- (2) Costs required for transporting Customer's equipment to repair shop, etc.
- (3) Profits lost due to a malfunction or repair, or any other consequential loss.

3. Warranty with charge

Company will charge for any investigation and repair of a malfunction in Goods (even during the warranty period) if caused by:

- Improper location, installation, lubrication, or maintenance by Customer's failing to follow the catalog, instruction manual, or similar. ("Instruction manual or similar" includes documentation specially provided to Customer.)
- (2) Operation methods (including usage conditions, usage environment, and allowable values) resulting from Customer's failure to follow operation described in the catalog, instruction manual, or similar. ("Instruction manual or similar" includes documentation specially provided to Customer.)
- (3) Inappropriate disassembly, modification, alteration, or processing by Customer.(4) Use of Goods by Customer in conjunction with damaged or worn parts not made by Company.
- (5) Failure of operational life under conditions of use as determined by Company to satisfy operational life covered by Warranty.
- (6) Use by Customer under conditions other than those discussed.
- (7) Consumption, wear, or deterioration of bearings, oil seals, oil, and other consumable parts incorporated into Goods.
- (8) Secondary failure or malfunction resulting from malfunctioning of Customer's equipment.
- (9) Malfunction of Goods resulting from a Force Majeure such as an act of God.
- (10) Malfunction of Goods resulting from a wrongful act committed by a third party.
- (11) Any other reason that is not attributable to Company.
